

TABLE OF CONTENTS

CHAPTER 1. INTRODUCTION TO ANALYTICAL THERMODYNAMICS	1
1.1 The nature of thermodynamic theory	1
1.2 Measurements of physical properties	2
1.3 Functions of physical variables	4
1.4 Physical processes: work and heat	6
1.5 Characterization of thermodynamic systems	11
1.6 Summary	12
CHAPTER 2. THE LAWS OF THERMODYNAMICS	14
2.1 The zeroth law of thermodynamics	14
2.2 The first law of thermodynamics	16
2.3 The second law of thermodynamics	22
2.4 Determination of the absolute temperature scale and entropy	27
2.5 Derivative relations among thermodynamic functions	30
2.6 The third law of thermodynamics	34
2.7 Summary	37
CHAPTER 3. THERMODYNAMICS OF DILUTE GASES	41
3.1 The ideal gas	41
3.2 The van der Waals gas	44
3.3 The virial expansion	47
3.4 Summary	47
CHAPTER 4. CONDITIONS OF THERMODYNAMIC EQUILIBRIUM	49
4.1 Real processes, equilibrium criterion, and constraints	49
4.2 Equilibrium conditions for simple systems	51
4.3 Open systems	52
4.4 Equilibrium of homogeneous chemical systems	57
4.5 Equilibrium of heterogeneous chemical systems	63
4.6 Equilibrium of nonuniform chemical systems	65
4.7 Summary	67
CHAPTER 5. SOLUTION THEORY	70
5.1 Ideal solutions	70
5.2 Colligative properties of ideal solutions	75
5.3 Chemical equilibrium in ideal solutions	79
5.4 The standard state	80
5.5 Nonideal solutions	83
5.6 Summary	85

CHAPTER 6. INTRODUCTION TO STATISTICAL MECHANICS	88
6.1 The scope of statistical mechanics	88
6.2 Statistical distributions	89
6.3 Stationary distributions	93
6.4 Determination of the equilibrium distribution	94
6.5 Summary	95
CHAPTER 7. THE MAXWELL-BOLTZMANN METHOD	97
7.1 Combinatorial mathematics	97
7.2 The most probable distribution	101
7.3 Characterization of distribution parameters	105
7.4 Indistinguishability	109
7.5 Properties of statistical-thermodynamic functions	112
7.6 Summary	116
CHAPTER 8. STATISTICAL-THERMODYNAMIC FUNCTIONS FOR SIMPLE SYSTEMS	119
8.1 The ideal gas: Maxwell-Boltzmann statistics	119
8.2 The ideal gas: Fermi-Dirac statistics	122
8.3 The ideal gas: Bose-Einstein statistics	127
8.4 The ideal gas: systems with internal motion	130
8.5 Partition function for the harmonic oscillator	131
8.6 Partition functions for rotational motion	133
8.7 Chemical equilibrium among ideal gases of diatomic molecules	135
8.8 Summary	136
CHAPTER 9. THE METHOD OF GIBBS	140
9.1 The canonical ensemble	140
9.2 Dispersions in statistical-thermodynamic properties	145
9.3 The grand canonical ensemble	149
9.4 Gibbs statistics for ideal gases	152
9.5 Transition to classical statistical mechanics	156
9.6 Summary	158
CHAPTER 10. STATISTICAL-THERMODYNAMIC FUNCTIONS FOR NONSIMPLE SYSTEMS	162
10.1 Slightly nonideal monatomic gases	162
10.2 Mixtures of slightly nonideal monatomic gases	165
10.3 Dilute electrolytic solutions: Debye-Hückel theory	169
10.4 Solids: Debye theory of specific heats	175
10.5 Order-disorder in solids: Bragg-Williams theory	178
10.6 Summary	185

CHAPTER 11. INTRODUCTION TO WAVE MECHANICS	188
11.1 The scope of wave mechanics	188
11.2 Survey of wave properties	189
11.3 Interference phenomena	194
11.4 Simple periodic waves	195
11.5 Matter waves	198
11.6 Operators and observables	201
11.7 Summary	204
CHAPTER 12. STATIONARY SOLUTIONS OF SCHROEDINGER'S EQUATION	206
12.1 The stationary state	206
12.2 Operators for physical observables	209
12.3 Physical states and wave functions	213
12.4 The free particle	214
12.5 The particle in a linear box	217
12.6 The linear harmonic oscillator: Schroedinger representation	218
12.7 The linear harmonic oscillator: momentum representation	222
12.8 The rigid linear rotor	226
12.9 The uncertainty principle	232
12.10 Summary	233
CHAPTER 13. ILLUSTRATIONS OF NONCLASSICAL BEHAVIOR	237
13.1 Rectangular barriers and wells	237
13.2 Model of molecular binding	242
13.3 Summary	245
CHAPTER 14. ALGEBRAIC METHODS FOR STATIONARY STATES	247
14.1 The variational method	247
14.2 The Rayleigh-Schroedinger series perturbation method	250
14.3 Matrix mechanics: stationary states	257
14.4 Symmetry properties of the Hamiltonian	261
14.5 Indistinguishability and exchange symmetry	269
14.6 Summary	272
CHAPTER 15. NONSTATIONARY STATES	275
15.1 Schroedinger's time-dependent equation	275
15.2 Heisenberg's equation of motion	276
15.3 Time-dependent perturbation theory of Dirac	279
15.4 Transition probabilities	282
15.5 Selection rules	286
15.6 Summary	289
